Tutorial No : 9

Tutorial Title: Write a C++ program that illustrates run time polymorphism by using virtual functions.

Name of Student: Shweta Lohakare

Class: SY **Div:** 2 **PRN No:** B25ET1099 **Batch:** B2

Program:

```
#include <iostream>
using namespace std;
class shape {
public:
   virtual void Draw() {
       cout << "\nDrawing shape";
   }
};
class circle : public shape {
public:
   void Draw() {
       cout << "\ndrawing circle";
   }
};
int main() {
   circle c1;
   shape s1;
   shape* str = &c1;
      str->Draw();
   s1.Draw();
   c1.Draw();
    return 0;
}
```

Output:

main.cpp

Run ▶

```cpp
#include <iostream>
using namespace std;

class shape {
public:
    virtual void Draw() {
        cout << "\nDrawing shape";
    }
};

class circle : public shape {
public:
    void Draw() {
        cout << "\ndrawing circle";
    }
};

int main() {
    circle c1;
    shape s1;
    shape* str = &c1;

    str->Draw();
    s1.Draw();
    c1.Draw();

    return 0;
}
```

Output

```
drawing circle
Drawing shape
drawing circle
```
